COMPARISON · LAYER 2 · BUILDERS

AIA vs n8n

you describe it, AIA builds it.

Two ways to automate a business process. One hands you a canvas. The other hands you a finished, deployed workflow.

Shayak Mazumder
Founder, CEO and CTO, Adya AI

N8N

A canvas you wire, node by node.

vs

ADYA · AIA

An agent that builds, deploys and improves it.

AGENTIC MODE

Two ways to automate a process: *draw it, or describe it.*

N8N · YOU BUILD IT

You draw the graph, then you own it.

01 Pick each node and map each field

02 Wire credentials, retries and error paths

03 Fix it when an API or the process changes

AIA · THE AGENT BUILDS IT

You state the outcome. AIA designs, tests and ships it.

01 Picks tools from 1,000+ MCP integrations

02 Validates and repairs the flow before it runs

03 Deploys it as an access-controlled endpoint

n8n's AI Assistant (Preview) drafts workflows from its node catalogue. No agent harness sits behind it; you still maintain the graph.

What n8n does well, *and where AIA keeps going.*

WHERE N8N IS STRONG

A large, loyal community
Popular with technical teams, with 400+ built-in integrations and community nodes.

Code when you need it
JavaScript and Python nodes for what the visual builder cannot express.

Self-hosted or cloud
Fair-code licence, priced per execution, unlimited workflows on every plan.

WHERE IT STOPS, AND AIA KEEPS GOING

You design every graph
AIA reads the goal, chooses the components and wires them itself.

You debug and maintain it
AIA validates and repairs the flow before it runs, and learns from every run through ESM.

It ends at the workflow
AIA calls Voice, WhatsApp, Coding Agent and Cloud Studio to build what surrounds it.

AIA and n8n, *side by side.*

	n8n	Adya AIA
Building	You drag, drop and wire nodes	The agent designs and wires it from your goal
Integrations	400+ built-in nodes	1,000+ MCP integrations via one gateway
Models	~20 chat-model provider nodes	350 LLMs, routed per step
Databases	Configured node by node	100 databases, mapped by the agent
Before it runs	You test runs and fix failures	Validates and repairs the flow itself
Deployment	Inside your n8n instance	Access-controlled endpoint, any cloud
Memory	Memory nodes inside a workflow	ESM across every run, fewer tokens each time
Governance	RBAC and audit logs on higher tiers	AGP checks every action before it runs

n8n figures from n8n's GitHub, docs and pricing page, October 2026.

One request, two journeys: *qualify every inbound lead.*

N8N

You, every step

01	02	03	04	05	06
Sketch the flow	Pick and place nodes	Add credentials	Map fields node to node	Test, debug, re-run	Host, monitor, fix drift

ADYA · AIA

The agent, you approve

01	02	03	04	YOU	05	06
Reads the goal	Picks tools and models	Wires and maps the data	Validates and repairs	**You approve**	Deploys the endpoint	Learns from every run

The agent does about 95% of the work. You approve the plan and the release.

Wider reach,
and the agent does the wiring.

1,000+
MCP integrations
One gateway and registry shared by every studio

N8N
400+ built-in nodes

350
LLMs
Each step routed by cost, latency and quality

N8N
~20 chat-model provider nodes

100
Databases
Connected and mapped by the agent

N8N
Set up node by node

~70%
Fewer tokens
ESM remembers past runs, so each build costs less

N8N
No memory across builds

ESM is the same memory layer behind RAS's 3.9x token cut against Claude Life Sciences, published October 2026.

What AIA does *on its own.*

WHAT IT DOES

01 Turns intent into a working agent or workflow

02 Selects tools from 1,000+ MCP integrations

03 Connects to 100 databases

04 Routes each step across 350 LLMs

05 Validates and repairs the flow before it runs

06 Deploys it as an access-controlled endpoint

WHY IT MATTERS

Developer mode when you want it

Open any node, edit it by hand, or let the agent carry on. Both modes share one graph.

It improves itself

A self-improvement pipeline uses ESM to learn from every run and propose better versions.

Reuse before you build

AIA checks the marketplace for an existing workflow before it builds a new one.

AIA calls other studios, *and they call AIA.*

IT CALLS

Voice Studio
Adds a voice agent to the workflow

WhatsApp Studio
Adds a WhatsApp journey

Coding Agent
Embeds the workflow as an app backend

Cloud Studio
Deploys the whole system

AIA
AGENTIC STUDIO

Loosely coupled. Each studio is an agent the others can call.

IT IS CALLED BY

SAI
Builds workflows inside any app

RAI
Spins up GTM automations on demand

Voice Studio
Adds an after-call workflow

WhatsApp Studio
Adds a back-end step to a journey

Coding Agent
Generates the workflow behind a feature

Under every studio, *the same three IPs.*

ESM · EVENT-SOURCED MEMORY

Remembers everything

Every run is an event. AIA starts each build from what worked before, with about 70% fewer tokens.

AGP · ADAPTIVE GOVERNANCE

Rules agents cannot break

Your SOPs become rules checked before any step acts. If a rule fails, the step does not run.

MAN HARNESS

Hundreds of agents, no bottleneck

Hundreds of agents and workflows run in parallel, peer to peer, with no central bottleneck.

Developer mode

Run any step by hand when you want to. The agent does about 95%; you supervise and decide.

Marketplace

Clone a ready workflow from the Adya marketplace instead of starting blank.

Alone, AIA builds the workflow.
Together, the whole system.

"Qualify every inbound lead, call the hot ones, and follow up on WhatsApp."

01
AIA
Builds the qualification workflow and CRM updates

→

02
Voice Studio
Builds the calling agent for hot leads

→

03
WhatsApp Studio
Sends the follow-up and a booking form

→

04
Coding Agent
Builds the sales dashboard on top

→

05
Cloud Studio
Deploys it all in your tenancy

One conversation. Five studios. One memory and one rulebook underneath.

Stop wiring.
Start describing.

AIA builds the rest.

Thank you.

Shayak Mazumder / Founder, CEO and CTO, Adya AI

IN ONE LINE

- **n8n**
  A canvas you wire and maintain by hand
- **AIA**
  An agent that builds, deploys and improves
- **Together**
  Workflows, voice, WhatsApp and apps on one fabric
