COMPARISON · LAYER 5 · PLATFORMS

RAS vs Claude Science

the same research, a fraction of the compute.

A research workbench for scientists, against a governed pipeline that ends in a board-ready, cited decision.

Shayak Mazumder
Founder, CEO and CTO, Adya AI

CLAUDE SCIENCE

A workbench for bench and computational scientists.

vs

ADYA · RAS

Research, analysis and strategy, with receipts.

AGENTIC MODE

Two ways to do research with AI: *a workbench, or a decision pipeline.*

CLAUDE SCIENCE · A SCIENTIST DRIVES IT

A workbench for scientists who run their own analyses.

01 A coordinating agent with 60+ skills and connectors

02 Notebooks, R and a cluster terminal

03 Built on Claude models, inside Claude

RAS · THE PIPELINE RUNS IT

Four agents turn one question into a board-ready, cited answer.

01 Enterprise search over your own documents and data with 60+ connectors (data and research tools)

02 Deep research with multi-source triangulation

03 Data analyst (World #3 BIRD) and a ten-probe red team

Same research questions, *a fraction of the compute.*

−74%

Input tokens

21.4M down to 5.5M across all runs

−87%

Output tokens

323K down to 42K across all runs

3.9×

Fewer total tokens

21.7M down to 5.6M

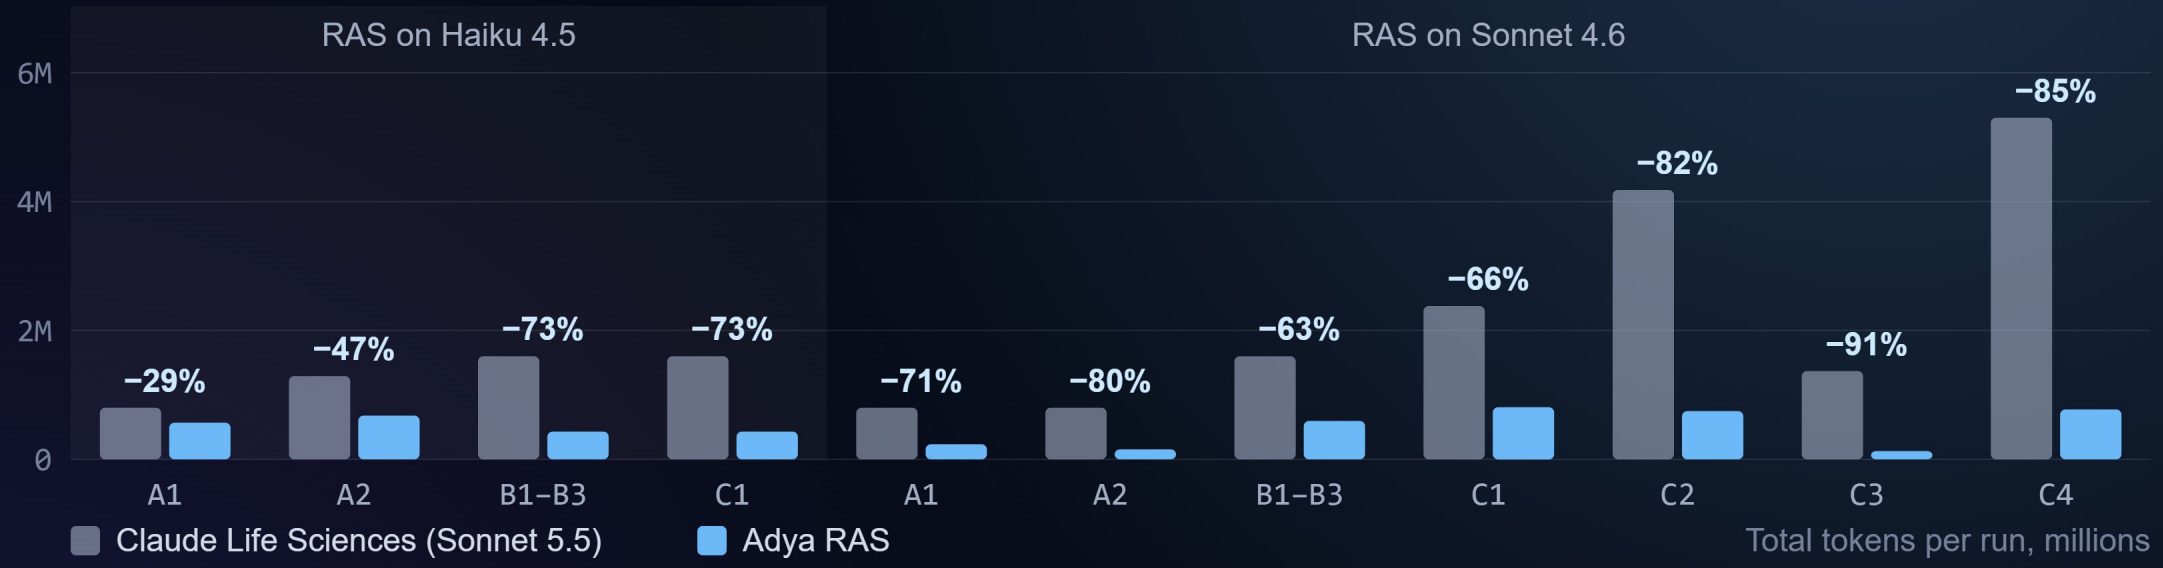

2.9×

Faster to answer

89 minutes down to 31 minutes

11 life-sciences tasks, same prompts. Claude Life Sciences on Sonnet 5.5; RAS on Haiku 4.5 and Sonnet 4.6. Adya, October 2026.

The harder the task, *the bigger the gap.*

Lookups: 56% fewer tokens. Cross-checks: 81% fewer. ACMG/AMP classification fell from 32 minutes to just over 6.

Why RAS uses less:
memory and a disciplined pipeline.

EVERY RAS RUN

01 Enterprise Search always runs first

02 Gap radar finds what your data cannot answer

03 Deep Research runs only for those gaps

04 Data Analyst runs only when numbers are needed

05 Strategy agent builds the evidence graph

06 Ten-probe red team before you see it

WHY IT MATTERS

ESM picks the context

Each step gets the events it needs to decide as it would with full history, at a fraction of the tokens.

A spend governor

Per-run and monthly caps on research spend, set and approved by you.

Every claim has a receipt

A two-source minimum, and every claim bound to a source, page or row.

RAS and Claude Science, *side by side.*

	Claude Science	Adya RAS
Built for	Bench and computational scientists	Research, strategy and investment teams
Your own data	Connectors to lab systems	Enterprise search, knowledge graph, gap radar, 60+ connectors (data and research tools)
External research	Literature through connectors	Triangulated, trust-scored, spend-capped
Numbers	Analyses in notebooks and R	Plain English to SQL, World #3 BIRD-Bench
Review	Checks its own work	Ten-probe adversarial review gate
Output	Analyses with provenance	Board-ready document, every claim cited
Memory	Session and project context	ESM: reproducible, diffable, forkable
Deployment	Claude, on Anthropic's cloud	SaaS, BYOC, on-prem or air-gapped

RAS calls other studios, *and they call RAS.*

IT CALLS

AI ELT
Brings in data from any source

ESM
Holds the company brain's memory

Model Studio
Trains a domain model when needed

Loosely coupled. Each studio is an agent the others can call.

IT IS CALLED BY

RAI
Researches markets and competitors

Voice Studio
Pulls cited knowledge into calls

Karma
Answers from the company brain

SAI
Adds research to any app

Under every studio, *the same three IPs.*

ESM · EVENT-SOURCED MEMORY

Remembers everything

Every artifact is reproducible, diffable and forkable. Each step gets the context it needs, at far fewer tokens.

AGP · ADAPTIVE GOVERNANCE

Rules agents cannot break

Who may ask, read and spend is a rule, checked before each step, with a full trail behind every answer.

MAN HARNESS

One orchestrator, four agents

Search, research, analysis and strategy agents run under one orchestrator, in parallel where they can.

Human assistant

Answers routine questions for you when you are away, if the evidence is strong. Spend waits for you.

Doctrine engine

Learns your firm's rules and applies them to every analyst's output.

Alone, RAS makes the decision.
Together, it acts on it.

"Should we enter the GLP-1 CDMO market in India, and who should we talk to first?"

01
AI ELT
Brings in sales, pipeline and filings data

→

02
RAS
Builds the cited, red-teamed market case

→

03
RAI
Runs outreach to the top-ranked accounts

→

04
Voice Studio
Follows up with calls in the right language

One question. Four studios. From evidence to pipeline, with one memory.

Same research. Fewer tokens.

Answers with receipts.

Thank you.
